New nucleic acids encoding a ribonuclease (Rnase), useful for the precise targeting of Rnase to a predetermined cell receptor.
                                                                                                                                                                                      The present sequence represents a frog ribonuclease protein (ranpirnase) (RNase). The specification describes a synthetic ribonuclease protein, in which the addition of cysteine in the ribonuclease facilitates the chemical linking of a targeting molecule by the single reactive sulfhydryl group. The specification also describes a method for the production of ranpirnase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for the ribonuclease to be delivered to a particular cell receptor where it might be most effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Search completed: May 7, 2004, 21:38:28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana pipiens occytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to inhibit tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant Onc protein with glutamine residue at position 1 - useful as antitumour and antiviral agent, also as cell culture selection agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

cancer; frog; autoimmune disease.

```
The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met23Leu. Carboxy terminal end of recombinant RaPLRI has a dovalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadorrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytochoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

```
The present sequence is a recombinant Rana pipiens ribonuclease protein (RaPLRI) with Met at position 1 attached to (His)6 tag and Met24Leu. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties form expression proteins. They can be need for treatment of cancer and authorizants.

Kaposi's Sarcoma, human chorionic gonadotrophin; hCG; cancer; recombinant ribonuclease; frog; signal peptide; cytotoxic fusion protein;

```
gonadotrophin (hCg) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methicinine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
             Recombinant Met(-1) Rana pipiens ribonuclease; RaPLR1; CD22; RNase; covalently bound; LL2 antibody; ligand binding moiety; cancerous B cell; Kaposi,'s sarcoma; human chorionic gonadotrophin; hGG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met at position 1. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rana pipiens ribonuclease Clone 5alb; RaPLR1; covalently bound; RNase; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; onconase;

```
The present sequence is a Rana pipiens clone 5alb ribonuclease (RapIRI). It is encoded by Clone 5alb cDNA obtained from Rana pipiens liver mRNA library. It exhibits differences with Oncoase (RTM) at amino acid residues 11, 20, 85 and 103. Carboxy terminal end of RapIRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methicnine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonucleases allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant Rana pipiens ribonuclease; RaPLR1 Met23Leu; covalently bound;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a specifically claimed example of an antitumour protein from the generic protein in AAW18224, with the molecular weight 12000. This is one of two preferred proteins (the other in AAW6543) that have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the treatment of tumours

Carboxy terminal end of RaPLRI has a covalently bound ligand binding mobiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                        Rana pipiens liver ribonuclease, RaPLR1; covalently bound; LL2 antibody, ligand binding moiety; CD22; cancerous B cell; Kaposi's Sarcoma; frog; human chorionic gonadotrophin; hCG; recombinant ribonuclease; RNase; signal peptide; cytotoxic fusion protein; cancer; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28

The present sequence is a recombinant Rana catesbeiana oocyte ribonuclease (RaCOR1) protein with Met at position 1 attached to a (His)6 tag, MetZiBeu and MetSiBeu. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (RG) effective against Kaposi's sarcoma calls. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune Met(-1) Rana catesbeiana ribonuclease Met22Leu Met57Leu-(His)6; RaCOR1; recombinant; CD22; covalently bound; LL2 antibody; ligand binding moiety; cancerous B cell; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; bullfrog; RNase; autoimmune disease. This invention describes a novel nucleic acid construct comprising sequences encoding functional pancreatic RNase and a second protein (preferably the light and heavy chains of an antibody) which binds a specific cell surface marker on a target cell and functions as a cyperising surface marker on be used for selectively killing cells cytotoxic agent. The products can be used for treating tumors or infected cells (e.g. cells infected by viruses (especially latent or chronic virus infections, such as human immunodeficiency virus (HIV)-1. Epstein-Barr virus, herpes viruses (herpes simplex types I and II), hepaticis viruses (B, non-A-non-B, and delta), herpes zoster. Cytomegalovirus) and cells infected with parasites (such as the malaria parasite)). They can also be used for treating immune dysfunctional cells in immune and autoimmune diseases. Additionally, they may be used as contraceptives. Finally they can also be used for cell separation in throby selectively killing unwanted types of cells (e.g. in bone marrow) prior to transplantation into a patient undergoing marrow calls in box selectively can also be used as carrow) prior to transplantation into a patient undergoing marrow calls in the patient of the killing leukemia cells or T-cells that would cause graft-versus-host disease. This sequence represents a bullfrog

Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LLZ antibody directed against CD22 on cancerous 3 cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Neterminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

Carboxy terminal end of recombinant BacOR1 has a covalently bound ligand binding molety, which can be a LL2 antibody directed against CD22 on cancerous B cells or muman chorinoir gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

```
The present sequence is a recombinant Rana catesbeiana oocyte recombinant RaCOR1) protein with Gln16er. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadorrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Neterminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                             Recombinant Rana catesbeiana oocyte ribonuclease; RacOR1 Gln1Ser; CD22; covalently bound; LL2 antibody; ligand binding moiety, cancerous B cell; bullfrog; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; RNase; signal peptide; recombinant ribonuclease; cytotoxic fusion protein;

New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

Claim 22; Page 62; 71pp; English.

The present sequence is a Rana catesbeiana oocyte ribonuclease (Racori) protein encoded by a cDNA modified for expression in B. coli. Carboxy terminal end of Racori has a covalently bound ligand binding moiety, which can be a LLZ antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Raposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds
-!- function the surface of endothelial cells; once bound,
angiogenin is endocytosed and translocated to the nucleus, thereby
promoting the endothelial invasiveness necessary for blood vessel
formation. Angiogenin induces vascularization of normal and
malignant tissues. Abolishes protein synthesis by specifically

Biol. Evol. 19:438-445(2002).

-!-FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

J. 157:317-323 (1976).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3-phosphooligonucleotides ending in C-P or with 2',3'-cyclic phosphate intermediates.
-!- SUBCELULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                       -i- TISSUE SPECIFICITY: Pancreas.
-i- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21-JUL-1986 (Rel. 01, Created)

Lo actin on the surface of endothelial cells; once bound angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endocytosed and translocated to the nucleus, thereby promoting the endochtolial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and mailgnant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular triNAs. Binds tightly to placental ribonuclease inhibitor and has very low ribonuclease activity.
Li SUBCELLULIAR LOCATION: Secreted.
LI TISSUE SPECIFICITY: Serum and milk.
LI SINIARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DVDCNNIMSTNLF--HCKDKNTFIYSRPEPVKAICKGIIASKN------VLTTSEFYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Būkaryota; Metazoa; Čhordata; Craniata; Vertebrata; Buteleostomi;

             J. Biochem. 108:139-143(1990).
-!- FWOVTION: The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin preferentially agglutinate a large variety of tumor cells, but it does not agglutinate non-transformed cells and erythrocytes.
-!- SUBGELIULAR LOCATION: Secreted.
-!- SUBCILIULAR LOCATION: Secreted.
-!- STATIARRIP: Belongs to the pancreatic ribonuclease family.
PIR: JX0120: JX0120.

                                                                                                                                                                                                                                                                                                                                                                                             J. Blochem. 106:729-735(1989).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphateintermediates ending in C-P or U-P
with 2',3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

Chang cartesbelana structure of a cyctoxic ribonuclease from the occytes
of Rana catesbelana (bullfrog) ";
J. Mol. Biol. 283:231-244(1998)";
-!-FUNCTION: Preferentially cleaves single-stranded RNA at pyrimidine
-!-FUNCTION: Preferentially cleaves single-stranded RNA at pyrimidine
residues with a 3'flanking guanine. Hydrolyzes poly(U) and poly(C)
as substrates, and prefers the former. The S-lectins in frog eggs
may be involved in the fertilization and development of the frog
embryo. This lectin agglutinates various animal cells, including
normal lymphocytes, erythrocytes, and fibroblasts of animal and
human origin. It is cytotoxic against several tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SMATT; SW00092; KNASE PC; 1.

Pancreatic ribonuclease (EC 3.1.27.5) - cuis
NyAlternate names: RNase 1; RNase A
C'Species: Galea mustabloides (cuis)
C'Date: 03-Aug-1984 #sequence_revision 03-Aug-1984 #text_change 04-Oct-1996
C'Accession: A00827
R'Beintema, U.J.; Neuteboom, B.
J. Mol. Evol. 19, 145-152, 1983
J. Title: Origin of the duplicated ribonuclease gene in guinea-pig: comparison of the amir A; Reference number: A92957; MUD:87036770; PMID:6571219
A; Reference number: A92957; MUD:87036770; PMID:6571219
A; Residues: 1-124 - GBIY
A; Residues: 1-124 - GBIY
A; Robert one-third of the molecules lacked Ala-1
C; Comment: The cuis is a rodent belonging to the same subfamily as the guinea pig.
C; Comment: The cuis is a rodent belonging to the same subfamily as the guinea pig.
C; Superfamily: pancreatic ribonuclease
C; Comment: The cuis is a rodent belonging to the same subfamily as the guinea pig.
C; Superfamily: pancreatic ribonuclease
C; Comment: The cuis is a rodent belonging to the same subfamily as the guinea pig.
C; Superfamily: A1,119/Active site: His Lys, His #status predicted
F; 26-84,40-95,58-110,65-72/Pisulfide bonds: #status predicted
F; 26-84,40-95,58-110,65-72/Pisulfide bonds: #status predicted
F; 94/Binding site: carbohydrate (Asn) (covalent) #status absent
C;Species: Iguana iguana (common iguana)
C;Date: 19-War-1997 #sequence_revision 19-Mar-1997 #text_change 21-Aug-1998
C;Accession: S41111

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Eur. J. Biochem. 219:641-646(1994).

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphate intermediates.

-!- Subcellular Location Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
